Finite-source photometry and astrometry | $u_0 = 0.03$, $\rho = 0.1$, $t_E = 20$ day, $\theta_E = 1.2$ mas
Light curve · source crossing
Point source
Uniform disk
Linear ($a_1 = 0.6$)
Magnification A
$t - t_0$ [day]
Shift along the trajectory
$\Delta\theta_\tau$ [mas]
$t - t_0$ [day]
Shift perpendicular to the trajectory
$\Delta\theta_\beta$ [mas]
$t - t_0$ [day]
Centroid-shift track · −40 to +40 day
$\Delta\theta_\beta$ [mas]
$\Delta\theta_\tau$ [mas]
Near closest approach
Arrows: increasing time
Axis scales differ
Dotted vertical lines: lens on the source limb. Shifts are relative to the unlensed source.
